LeSuccess Academy

Learn . Educate . Succeed | Official Course Syllabus

AWS & DevOps

Duration: 3-6 Months | Mode: HYBRID | 100% Placement Support

Detailed Curriculum & Module Outline:

Module 1: Linux and Shell Scripting

The filesystem, permissions, processes, networking commands and scripts that automate the borin

Module 2: Git and Branching Strategies

Branching, merging, pull requests, conflicts and a workflow a team can actually follow

Module 3: AWS Core Services for DevOps

EC2, S3, IAM, VPC and Lambda - the services your pipelines and workloads sit on

Module 4: Docker and Containers

Images, layers, volumes, networks and Compose, containerising a real application from its sourc

Module 5: Kubernetes Fundamentals

Pods, deployments, services, config maps and secrets, deployed to a working cluster

Module 6: Kubernetes in Production

Scaling, rolling updates, health probes, resource limits and debugging a pod that will not star

Module 7: CI/CD with Jenkins

Pipelines as code, build agents, artefacts and a pipeline that fails loudly and early

Module 8: CI/CD with GitHub Actions

Workflows, secrets, environments and deployment gates for teams already living in GitHub

Module 9: Infrastructure as Code with Terraform

Providers, state, modules and plan/apply discipline, building an environment from nothing

Module 10: Configuration Management with Ansible

Playbooks, inventories and idempotent changes across a fleet of servers

Module 11: Monitoring, Logging and Alerting

CloudWatch, Prometheus and Grafana, plus alerts that mean something at two in the morning

Module 12: Capstone: End-to-End Pipeline

One application taken from repository to a monitored, auto-deployed production environment
